## SESSION SUMMARIES

### Morning

Site 1 Great Sand Dunes Nat'l Mon. (at the foot of the Sangre De Cristo Mtns)

.... at the very beginning there were two gestalts present ...it was especially evident during the stage II's..... there were two opposite set of feelings, colors and textures.... one was cool, vertical, angular, hard, blues, grays..... the other was warm, flat, sandy, gritty, browns, yellows, orange, land..... ...the contrast between the mountains and sand dunes appear evident... there was some difficulty at first trying to determine whether the verticals and angles were structures, but a feeling of naturalness persisted throughout the entire site.

### Afternoon

Site 1 Okefenokee Swamp

.... feeling of energy, powerful vortex, motion, lots of activity..... most impressions do not seem to relate to the site, with the exception of some stage II data.... goopy, sticky dark, slow motion.... also had a definite feeling of being upside down at one point....

Site 2 Surface of the Sun

..... lots of AOL with this one..... the recurring visual was a very blue, circular mass surrounded by a black void....

### Conclusion:

Overall, today's sessions went quite well..... not receiving much input as to sounds, smells or tastes.... the sound may be blocked by noise pollution from area background.
